Problem A. Testrun

This contest is open for practice. You can try every problem as many times as you like, though we won't keep track of which problems you solve. Read the [Quick-Start Guide](#) to get started.

small

0 points

2 minute timeout

The contest is finished.

Problem

This is a way to test your solutions, not a real problem!

When you submit a solution to this problem, it will run one testcase on a 100 nodes. This will allow you to estimate how fast your solution will run on our system.

Remember to change your solution appropriately before submitting it for real, so you don't fail because of a compilation error! The best way to check is to run your solution on the small input before submitting to the large input.

Input

There is no input for this problem. This means you should not include / import an input library.

Output

Doesn't really matter what you output. If your solution runs successfully to completion, it will be judged as "Wrong Answer".

Limits

Each node will have access to 1 GB of RAM, and a time limit of 26 seconds. The maximum number of messages a single node can send is 5000, and the maximum sum of the sizes of those messages is 8MB.

This problem only has one small test case. It will run on 100 nodes.

Problem

Your country is electing its president, and you are in charge of the new electronic voting system. The citizens have voted, and now you have to check if any of the candidates obtained a *majority* — that is, if there is a candidate for whom more than half of the citizens voted.

Input

The input library will be called "majority", see the sample inputs below for examples in your language. It will define two methods: `GetN()`, which will return the number of voting citizens N , and `GetVote(i)`, which will (for $0 \leq i < N$) return the identifier of the candidate for whom citizen i voted.

Output

If any candidate obtained a majority of the votes, output the identifier of that candidate. Otherwise, output the string "NO WINNER" (quotes for clarity only). A single call to `GetVote(i)` will take approximately 0.025 microseconds.

Limits

Each node will have access to 128MB of RAM, and a time limit of 3 seconds.
 $0 \leq \text{GetVote}(i) \leq 10^9$ for all i with $0 \leq i < N$.

Small input

Your solution will run on 10 nodes.
 $1 \leq \text{GetN}() \leq 1000$.

Large input

Your solution will run on 100 nodes.
 $1 \leq \text{GetN}() \leq 10^9$.

Sample

Input	Output
See the input files below.	For sample input 1: 7
	For sample input 2: NO WINNER
	For sample input 3: NO WINNER

Note: the same problem idea was used by us in a tutorial in the Algorithmic Engagements contest in 2014.
