## Problem C. Bejeweled Befuddlement

This contest is open for practice. You can try every problem as many times as you like, though we won't keep track of which problems you solve. Read the [Quick-Start Guide](#) to get started.

Small input 1  
10 points

Small input 2  
20 points

Solve C-small-2

## Problem

John has been playing a lot Bejeweled lately, but he's becoming frustrated at his inability to get high scores. He would like a program to help him play, and you can help!

In Bejeweled, you have a grid of gems of various colors, such as the one below:

```
BGR
GRR
BGY
```

You make a move by switching two gems that are horizontally or vertically connected to each other. So, for example, you could switch the first two gems in the second row, changing the board to this:

```
BGR
RGR
BGY
```

If when you do this, any three gems in a row are the same color, they all disappear at once. So in this example, the three green gems would disappear.

```
B . R
R . R
B . Y
```

It can get a little more complex, though. Additionally, multiple sets of three (or more) can be formed at once. For example:

```
RG0Y
RG0G
00Y0
RG0G
YB0B
```

In this case, swapping the right-most orange in the middle row with the yellow next to it...

```
RG0Y
RG0G
000Y
RG0G
YB0B
```

... makes a row of 3 and a column of 5, which all disappear...

```
RG . Y
RG . G
. . . Y
RG . G
YB . B
```

... and then, any gems that are above an open space fall down to fill the empty spaces...

```
. . . Y
RG . G
RG . Y
RG . G
YB . B
```

... and then any newly formed rows of three or more will also disappear:

```
...Y
...G
...Y
...G
YB.B
```

This continues until there are no more rows or columns of three or more similar colored gems formed. So, more generally, the process is as follows:

- Switch two gems
- While there are any rows or columns of three or more gems of the same color
  - Remove those gems
  - Move any gems that are above empty spaces down until there are no gems above empty spaces

Note: In the actual game, gems fall in from the top to replace removed gems. You do not need to take this into account.

#### Input

The first line of input will contain the number of test cases, **T**. Each test case will start with a line containing two integers, **N** and **M**, separated by a space. The next **N** lines will each contain exactly **M** uppercase letters, each representing one gem. Gems of the same letter are considered to be of the same color.

#### Output

For each test case, output a line of the form "Case #**C**: **D**", where **C** is the number of the test case, starting from 1, and **D** is the maximum number of gems that can be removed as a result of a single swap.

#### Limits

All gem characters will be upper-case letters.  
The input grid will not contain a row or a column of 3 or more gems of the same color appearing consecutively.

#### Small dataset

$1 \leq T \leq 20$ .  
 $3 \leq \text{number of rows} \leq 10$ .  
 $3 \leq \text{number of columns} \leq 10$ .

#### Large dataset

$1 \leq T \leq 100$ .  
 $1 \leq \text{number of rows} \leq 50$ .  
 $1 \leq \text{number of columns} \leq 50$ .

#### Sample

Input	Output
3	Case #1: 3
3 3	Case #2: 13
BGR	Case #3: 0
GRR	
BGY	
5 4	
RG0Y	
RG0G	
00Y0	
RG0G	
YBOB	
3 3	
ABC	
DEF	
GHI
